

30 Days of API Integration Plan

A Daily Build-in-Public GitHub Portfolio Roadmap

Featuring 2 APIs per day for a total of 60 unique API integrations.

Designed for robust daily git commits, clean modular UI architecture, and high-impact showcases.

Target Directory: C:/Users/Neer/Videos/Github Projects/Project 3

Prepared by Antigravity for Neer

Introduction & Strategy

Welcome to the **30 Days of API Integration** challenge. This document provides a highly structured roadmap designed to keep your GitHub timeline active while building highly impressive micro-applications. By integrating two distinct APIs every single day, you will gain hands-on experience dealing with diverse data shapes, authentication models, asynchronous JS flow, and creative UI solutions.

Architecture Tips:

- Monorepo Setup:** Create a single parent repository with an index.html home portal, displaying 30 cards (one for each day). Clicking a card should navigate to that day's directory (e.g., /day01/index.html).
- Vanilla JS + Flexbox/Grid:** Keep it simple and blazing fast. Focus on clean CSS animations, glassmorphism UI, and solid error handling (e.g., gracefully handling API rate limits or network issues).
- Build-in-Public:** Include a screenshot or GIF preview in your repo readme every day, linking to the live hosting pages.

Day	APIs & Endpoints	Daily Integration Challenge Description
Day 01	1. IP-API: Geolocation based on client IP (Free, no key). 2. OpenWeatherMap API: Live weather forecast.	Detect client's location using IP-API, and automatically show current weather and temperature forecast for that location.
Day 02	1. NASA APOD: Astronomy Picture of the Day. 2. Open Notify: Live ISS tracking location coordinates.	Display NASA's daily celestial image alongside a map widget marking where the ISS is flying right now.
Day 03	1. CoinGecko API: Live cryptocurrency rates. 2. Frankfurter API: International currency conversions.	Show live Bitcoin & Ethereum rates in USD, with dropdown converters that immediately switch rates to EUR, GBP, or INR.
Day 04	1. The Cat API: Random kitty photos. 2. Dog API: Random dog photos sorted by breed list.	Create a 'Cats vs Dogs' vote dashboard. Render random cat & dog pictures side-by-side with a voting and counter system.
Day 05	1. ZenQuotes API: Motivational statements. 2. Unsplash API: High-resolution photography search.	Build a card generator where users fetch a motivational quote, search for a matching background, and download as an image.
Day 06	1. Jikan API: MyAnimeList catalog search. 2. Studio Ghibli API: Classic animated film listing.	Build an anime explorer showing current airing anime details alongside a retro list of Studio Ghibli's best films.
Day 07	1. Free Dictionary API: Definitions & audio pronunciation. 2. Datamuse API: Synonyms & rhyming words generator.	A dictionary dashboard that defines looked-up words, plays audio pronunciation, and suggests rhyming words.

Day	APIs & Endpoints	Daily Integration Challenge Description
Day 08	1. TheMealDB API: Culinary recipes and details. 2. TheCocktailDB API: Cocktails and beverages search.	A 'Dinner & Drink' matching engine. Generate a random gourmet dinner meal recipe paired with a matching themed drink.
Day 09	1. GitHub REST API: Repo details & commit stats. 2. Official Joke API: Programmer jokes generator.	Build a developer dashboard displaying your GitHub profile stats side-by-side with a daily programming joke.
Day 10	1. OMDb API: Movie search metadata and ratings. 2. TMDb API: Trending movie lists & video trailers.	A rich movie search catalog displaying descriptions, IMDB ratings, and matching trailers via video embed.
Day 11	1. Wger Workout API: Exercises & routines. 2. Open Food Facts: Product search and ingredients list.	Generate a random workout routine and let users search snacks to check calories/health scores to fuel that workout.
Day 12	1. Currents API: Global live news articles feed. 2. Nager.Date API: Calendar public holidays lookup.	Interactive global news aggregator where selecting a country highlights local holidays and feeds matching local news headlines.
Day 13	1. FreeToGame API: Database of free-to-play games. 2. RAWG API: Detailed reviews, ratings, and gaming screen galleries.	A visual showcase catalog of the best free-to-play games including screenshot sliders and aggregate ratings.
Day 14	1. REST Countries API: Comprehensive country profiles. 2. ipify API: Client external IP checking.	Fetch client IP, find country location, and display details like currency, borders, and population alongside flag SVGs.
Day 15	1. Lyrics.ovh API: Song lyrics search. 2. Deezer API: Music streaming and track previews.	A music companion where users search for a song, view full lyrics, and listen to a 30-second audio preview of the track.
Day 16	1. JokeAPI: Multi-category general and tech jokes. 2. Imgflip API: Popular blank meme templates catalog.	An interactive Meme generator that overlays random funny jokes onto popular image templates from Imgflip.
Day 17	1. Open Library API: Extensive book database. 2. Gutenberg API: Public-domain book catalog.	A library search engine. Users search for book titles, view author information, and get direct links to read ebooks.

Day	APIs & Endpoints	Daily Integration Challenge Description
Day 18	1. Met Museum API: Collection of classic artwork. 2. Art Institute of Chicago API: Chicago's fine art catalog.	Virtual art museum comparisons. Fetch matching search items and render art masterpieces from NYC and Chicago.
Day 19	1. LeetCode API: User statistics and active challenges. 2. Codewars API: Kata submissions and code warrior level.	Assemble a developer coding dashboard merging stats, achievements, rank levels, and challenges completed from both platforms.
Day 20	1. Teleport API: City metrics (cost, safety, health). 2. RoadGoat API: Detailed travel destination data.	A destination comparator. Select two global cities and visually contrast their cost of living, safety ratings, and highlights.
Day 21	1. Open Trivia DB: Diverse multiple-choice quiz questions. 2. Numbers API: Numeric trivia statements.	Trivia board game. Every time a user answers a trivia question correctly, show them a math trivia fact about their current score.
Day 22	1. Bored API: Anti-boredom activity suggestions. 2. Advice Slip API: Daily wisdom and suggestions.	Self-care selector. Generates an active, healthy task suggestion paired with matching wise advice for the day.
Day 23	1. Fake Store API: Mock e-commerce products & price data. 2. Stripe Mock checkout: Simulated payment processing gateways.	Interactive catalog with add-to-cart, subtotal calculations, and a simulated credit card checkout flow overlay.
Day 24	1. Google Fonts API: Available web layout typography. 2. Colormind API: AI-generated color palettes.	A design mock sandbox. Generates combinations of web fonts with matching color schemes for fast previewing.
Day 25	1. TinyURL API: URL link shortener. 2. QR Server API: Dynamic QR code SVG generators.	Enter a long link, get a shortened URL using TinyURL, and instantly render a download-ready QR code pointing to it.
Day 26	1. Aviation Edge: Live airline lists and updates. 2. OpenSky Network: Active flight coordinates tracking.	Airport tracker. Input flight numbers to view departure times, destination airports, and estimated current map positions.
Day 27	1. World Time API: Time zones and local time. 2. OnThisDay API: Events on this day in history.	An interactive clock dashboard. Selecting a timezone displays the local time and details historical events occurring today.
Day 28	1. Abstract Email Validator: Verifies email deliverability. 2. QR Server API: QR Generator.	A validation widget. Takes an email input, queries Abstract to check validity, and prints a success QR code if it passes.

Day	APIs & Endpoints	Daily Integration Challenge Description
Day 29	1. Sunrise-Sunset API: Solar times by coordinates. 2. OpenStreetMap Nominatim: Coordinate search.	Search a city to get coordinates, then request solar phases to render a sunrise, sunset, and solar noon dial display.
Day 30	1. LibreTranslate API: Free text translator. 2. Text Processing API: Text Sentiment analysis.	Translate user-submitted texts into another language, and automatically evaluate the sentiment polarity (positive/negative).
